

# iTunes Error 7 Windows error 193

Fix for the error that work for me is <https://support.apple.com/en-us/HT204972>. Not only iTunes was fixed that way, but also [duet](#) application start work after fix.

1. Navigate to `C:\Windows\System32`.
2. Locate the `msvcr100.dll` file.  
Make sure that the file name is exactly `msvcr100.dll`. If you're unable to locate `msvcr100.dll`, do not continue with these steps and do not move other files from this folder.
3. Drag `msvcr100.dll` to the desktop. When prompted, click Continue.
4. After you drag the file to the desktop, try performing a repair on both installed versions of Apple Application Support (64 and 32-bit) in the Add/Remove Programs list in the Control Panel. iTunes requires both versions of Apple Application Support. Learn how to navigate to the Add/Remove programs list in [Windows 7](#), [Windows 8](#), and [Windows 10](#), then follow these steps:
  - Click Apple Application Support 32-bit to select it.
  - Right-click Apple Application Support 32-bit to open the shortcut menu.
  - Select 'Repair' and complete the Repair Wizard.
  - Perform the same steps for Apple Application Support 64-bit.
5. Try to launch iTunes.
6. If there's still an issue, [download a new copy of the iTunes installer](#).
7. Completely [remove and reinstall iTunes and related software components](#) from your computer. Then, reinstall iTunes.
8. If you still see the messages, restart your computer and try to launch iTunes again. If iTunes launches correctly, place `msvcr100.dll` in the Recycle Bin and then empty the Recycle Bin.
9. If there's still an issue, [contact Apple Support](#) for more help.
